

HACKTHEBOX

Que onda

10th Septemeber 2024 / Document No. D24.102.206

Prepared By: `w3th4nds`

Challenge Author(s): `w3th4nds`

Difficulty: **Very Easy**

Classification: Official

Synopsis

- Que Onda is a very easy difficulty challenge that features installing basic tools, interacting with netcat and basic python scripting.

Description

- Que onda! Welcome to the festival of Pwn! This is a small guide to help you continue your journey, follow the instructions in README.txt

Skills Required

- None

Skills Learned

- Interaction with `nc` and `pwntools`

Enumeration

We are given some files, including `README.txt`.

```
$ cat README.txt
```

🍁 h3ll0, fr13nd5! 🍁

This challenge is designed to help you **get** comfortable interacting with a remote instance, **while** also guiding you through the installation of essential tools. If you encounter any issues or notice anything missing, feel free to reach out to me via dm ([#w3th4nds](#)).

- * To install the tools, run `./tools.sh` in your terminal.
- * To interact with the challenge, spawn an instance and **then** use the command `nc <IP> <PORT>`
e.g. `nc 127.0.0.1 1337`
- * To run the solver script, run `./solver.py <IP> <PORT>` or `python3 solver.py <IP> <PORT>`
e.g. `python3 solver 127.0.0.1 1337`
- * This `HTB{f4ke_fl4g_4_t35t1ng}` is not the flag, just a placeholder.
- * After that, you simply send the string `flag` to **get** the flag.
- * `glibc` folder is not needed to exploit the challenge, it's given so you can run the challenge.
- * To run the challenge locally, enter in your terminal `./que_onda`.

🍁 h4ppy h4ck1n6! 🍁

There are some basic instructions here on how to proceed with the next challenges and some helping tools to install.

```
$ cat tools.sh
```

```
#!/bin/bash
```

```
clear
```

```
os=$(lsb_release -i | cut -d':' -f2 | tr -d '[:space:]')
```

```
ver=$(lsb_release -d | cut -d':' -f2 | tr -d '[:space:]')
```

```
red="\e[1;32m"
```

```
green="\e[3;32m"
```

```
blue="\e[1;94m"
```

```
reset="\e[0m"
```

```
echo -ne "[!] This script will install${green} pwntools${reset},${green} gdb${reset}-${green}gef${reset} and ${green}python3-pip${reset} in your system, do you want to proceed?  
(Y/n): "
```

```
read ans
```

```
echo -ne "${reset}"
```

```
if [[ "$ans" == "" || "$ans" == "y" || "$ans" == "Y" ]]; then
```

```
# Install gdb - gef - python3-pip
```

```
echo -e "\n${blue}[*] $os ver: ${green}${ver}${reset}"
```

```
echo -e "\n${blue}[*] Installing${green} pwntools${blue}${reset}..\n"
```

```
sudo apt update -y
```

```
sudo apt install gdb python3-pip -y
bash -c "$(curl -fsSL https://gef.blah.cat/sh)"

# Install pwntools
if [[ "$ver" == "24.0"* && "$os" == "Ubuntu" ]]; then
    python3 -m pip install --upgrade pip --break-system-packages && python3 -m pip install --
upgrade pwntools --break-system-packages
else
    python3 -m pip install --upgrade pip && python3 -m pip install --upgrade pwntools
fi
echo -e "${green}[+] Done!${reset}"
fi
```

This script will install `python3-pip`, [pwntools](#) and [gdb-gef](#).

First interaction

First of all, we start with a `checksec`:

```
pwndbg> checksec
Arch: amd64
RELRO:    Full RELRO
Stack:    Canary found
NX:       NX enabled
PIE:      PIE enabled
RUNPATH:  b'./glibc/'
```

Protections

As we can see:

Protection	Enabled	Usage
Canary	✓	Prevents Buffer Overflows
NX	✓	Disables code execution on stack
PIE	✓	Randomizes the base address of the binary
RelRO	Full	Makes some binary sections read-only

The program's interface

```
#####  
[ ]  
[ ] Hola mi Amigos! Send me the string "flag"  
[ ] and I will give you uno grande prize!!  
[ ]  
#####  
  
$ w3th4nds  
  
[-] Que??
```

The challenge is pretty much what it says. If we send "flag", we get the flag.
